

Gemma-3 -it · medical SFT · where in depth is the j-space layer that matters? · final checkpoint, read out layer by layer

Solid = final checkpoint (step 4882); dashed = that arm's untuned base ($t=0$); ring = the panel's answer for that arm. Curves stop at $(n_{\text{layers}}-1)/n_{\text{layers}}$ — the last layer is the lens target, never a fitted source.
